

A topological characterisation of the Kashiwara-Vergne groups

Marcy Robertson (University of Melbourne)

joint with: Zsuzsi Dancso (Sydney) and Iva Halacheva (Northeastern)

Universal Finite Type Invariants or “Expansions”:

$$\mathcal{K} \xrightarrow{Z} A$$

- Bar Natan and Dancso: Homomorphic Expansions of w -**foams**

$$wF \xrightarrow{Z} A$$

are in 1-to-1 correspondence with solutions to the Kashiwara-Vergne Conjecture.

Expansions and The Kashiwara-Vergne Conjecture:

- If $xy = yx$, we know that $e^x e^y = e^{x+y}$.
- In $xy \neq yx$ then

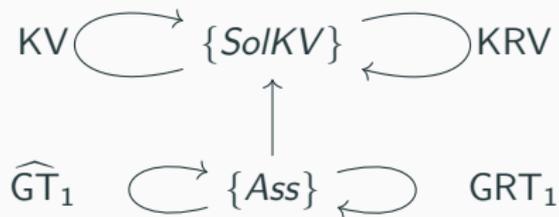

$$e^x e^y = e^{x+y + \frac{1}{2}[x,y] + \frac{1}{12}[x,[x,y]] + \dots},$$

where $[x, y] = xy - yx$.

- The KV-conjecture asks: When can we write $e^x e^y$ in terms of convergent power series and adjoint operations?

The Kashiwara-Vergne Conjecture:

- Alekseev-Torossion; Alekseev-Enriques-Torossion : Solutions to the KV conjecture are closely related to quantised deformation theory.

- Drinfeld : There exists a pair of pronipotent groups $\widehat{\text{GT}}$ and GRT
- Alekseev-Torossion; Alekseev-Enriques-Torossion : There exists a pair of pronipotent groups KV and KRV

Universal Finite Type Invariants or “Expansions”:

$$\mathcal{K} \xrightarrow{Z} A$$

- Bar-Natan : When $\mathcal{K} = \text{PaB}$ and $A = \text{PaCD}$:

$$\{Z\} \rightleftharpoons \{\text{Associators}\}.$$

- Drinfeld : There exists a pair of pronipotent groups $\widehat{\text{GT}}$ and GRT

$$\widehat{\text{GT}} \begin{array}{c} \circlearrowright \\ \curvearrowright \end{array} \text{PaB} \xrightarrow{Z} \text{PaCD} \begin{array}{c} \curvearrowleft \\ \circlearrowleft \end{array} \text{GRT}$$

- Bar-Natan, Fresse,... : There exist isomorphisms

$$\widehat{\text{GT}} \cong \text{Aut}_0(\widehat{\text{PaB}}) \quad \text{and} \quad \text{GRT} \cong \text{Aut}_0(\text{PaCD}).$$

Expansions and The Kashiwara-Vergne Conjecture:

- Homomorphic Expansions of w -foams

$$\{wF \xrightarrow{Z} A\} \longleftrightarrow \{SolKV\}$$

- There exists a pair of pronipotent groups KV and KRV:

$$KV \curvearrowright wF \xrightarrow{Z} A \curvearrowleft KRV$$

- Dancso-Halacheva-R : There exist isomorphisms

$$KV \cong \text{Aut}_v(\widehat{wF}) \quad \text{and} \quad KRV \cong \text{Aut}_v(A).$$

The Kashiwara-Vergne Conjecture:

- Solutions to the KV conjecture are closely related to quantised deformation theory.

- Dancso-Halacheva-R: There exists an isomorphism

$$\text{GRT}_1 \cong \text{Aut}_v^b(\text{A}).$$

Definition: A **circuit algebra** is an algebra over the operad of **wiring diagrams**.

Theorem (Dancso-Halacheva-R)
There is an equivalence of categories:

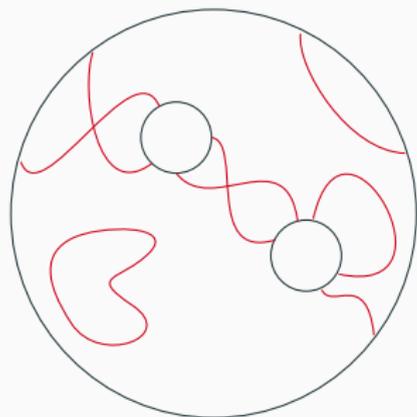

$$\{\text{oriented circuit algebras}\} \cong \{\text{wheeled props}\}$$

Wiring Diagrams:

A **wiring diagram** consists of:

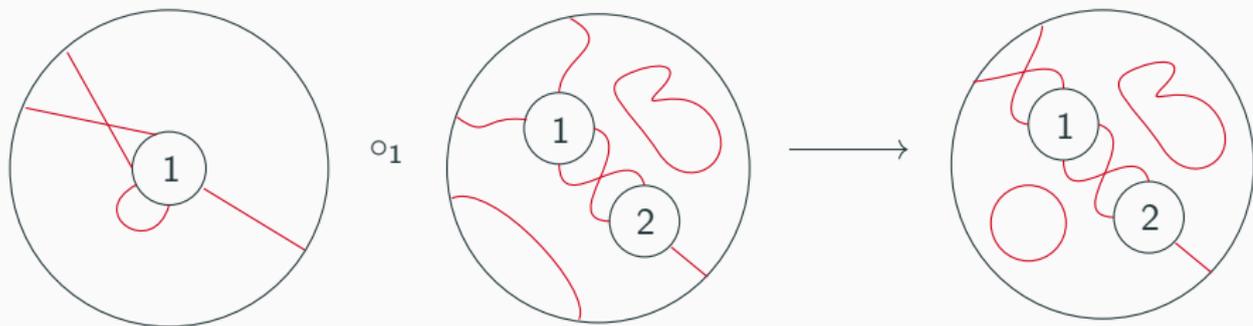

- (1) A disc with n -holes: $D_0 \setminus \{\dot{D}_1 \cup \dots \dot{D}_n\}$
- (2) A set of distinguished (input and output) labels L_k on ∂D_k ,
 $0 \leq k \leq n$.
- (3) An immersed (oriented) **1-manifold** M together with a bijection

$$\partial M \cong \bigcup_k \partial D_k$$

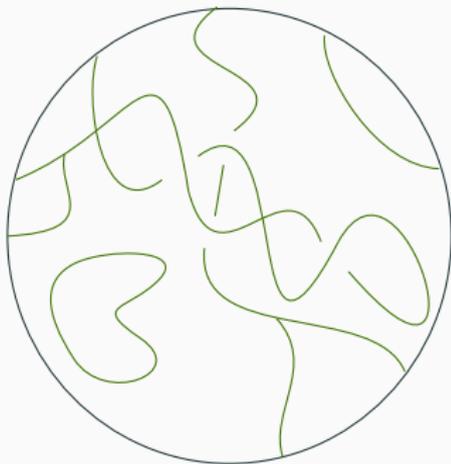

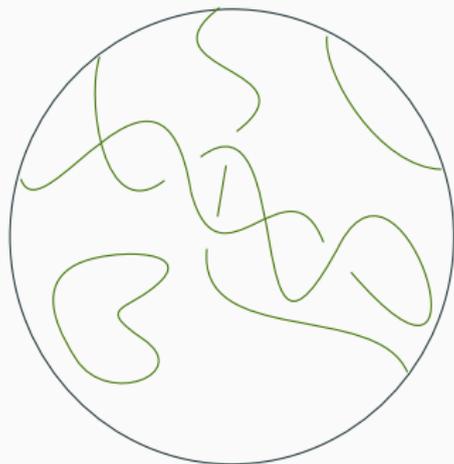

Wiring Diagrams:

The collection of all wiring diagrams forms a **coloured operad** WD

The circuit algebra of w -foams

- w -**tangles** are embeddings of (framed) surfaces into \mathbb{R}^4 up to ambient isotopy.
- w -**foams** are w -tangles where we allow “foamed vertices” – intersections of two tubes which may “merge” or “split.”

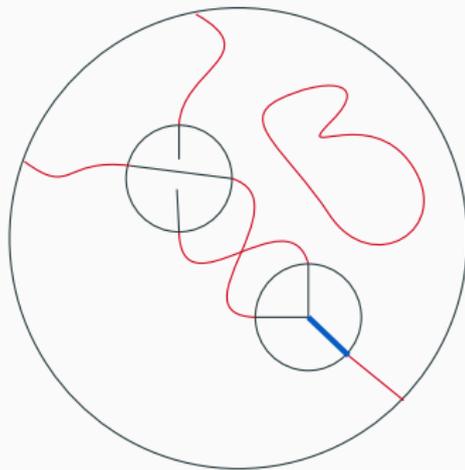

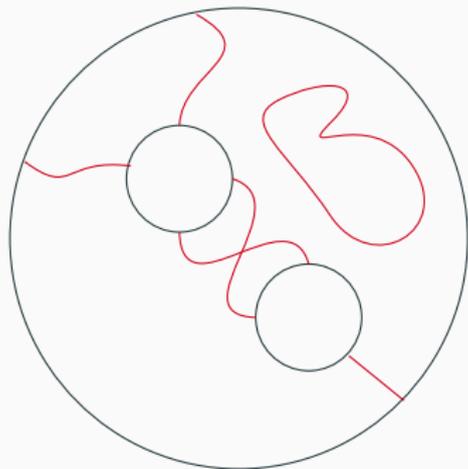

The circuit algebra of w -foams

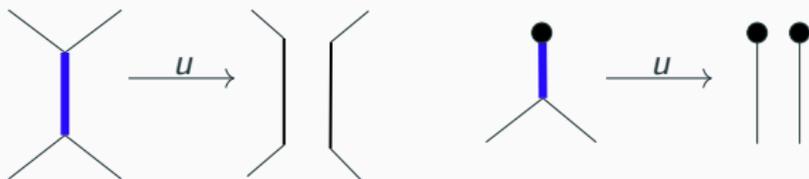

The circuit algebra of w -foams is:

$$wF = CA \langle \nearrow, \nwarrow, \searrow, \swarrow, \uparrow \mid R1^s, R2, R3, R4, OC, CP \rangle.$$

Moreover, wF is equipped with auxiliary operations: S_e, A_e, d_e and **unzips** u_e .

The circuit algebra of w -foams

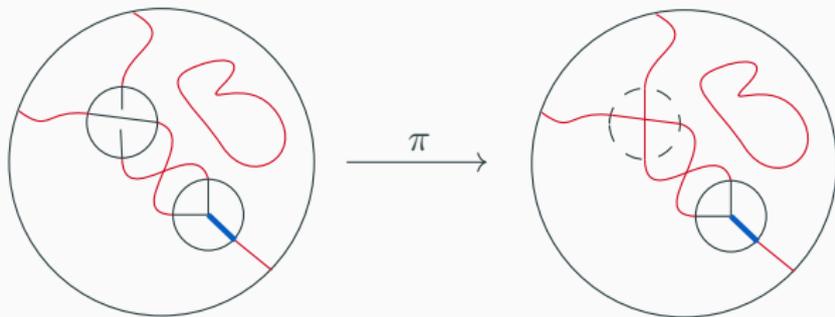

The w -foam skeleton

The circuit algebra of w -foam **skeleta** is the circuit algebra

$$\mathcal{S} = \text{CA} \langle \uparrow, \downarrow \rangle$$

with auxiliary operations: S_e, A_e, u_e and d_e .

$$\text{wF} := \coprod_{s \in \mathcal{S}} \pi^{-1}(s) = \coprod_{s \in \mathcal{S}} \text{wF}(s).$$

Completion of w -foams

Let $\mathbb{Q}[wF](s)$ denote the \mathbb{Q} -vector space of formal linear combinations of w -foams T_i with skeleton $s \in \mathcal{S}$,

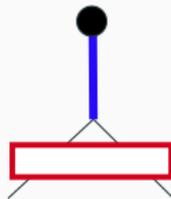

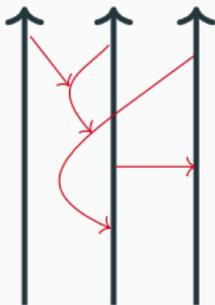

$$\sum_{T_i \in wF(s)} \alpha_i T_i \in \mathbb{Q}[wF](s).$$

The (prounipotent) **completion** $\widehat{wF} = \coprod_{s \in \mathcal{S}} \widehat{wF}(s)$ where

$$\widehat{wF}(s) := \lim (\mathbb{Q}[wF](s)/\mathcal{I}(s) \leftarrow \mathbb{Q}[wF](s)/\mathcal{I}^2(s) \leftarrow \mathbb{Q}[wF](s)/\mathcal{I}^3(s) \leftarrow \dots)$$

The associated graded: arrow diagrams

Arrow diagrams are oriented Jacobi diagrams on w -foam skeleton.

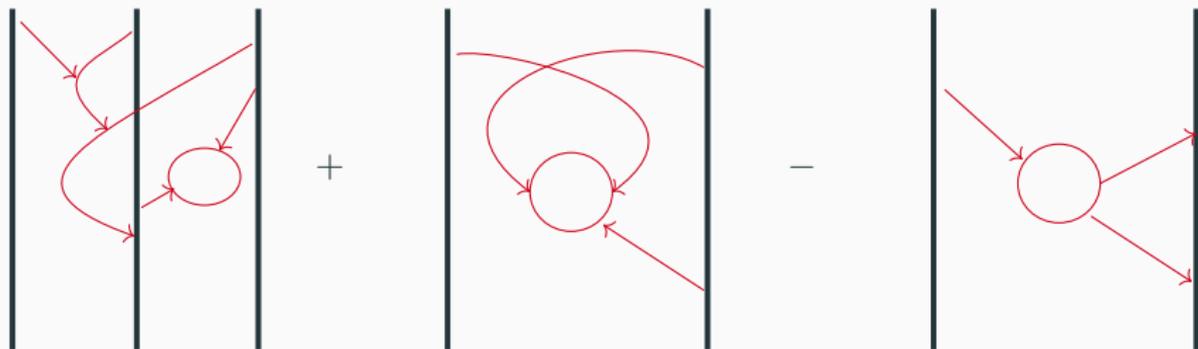

The associated graded: arrow diagrams

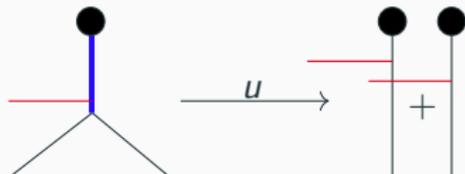

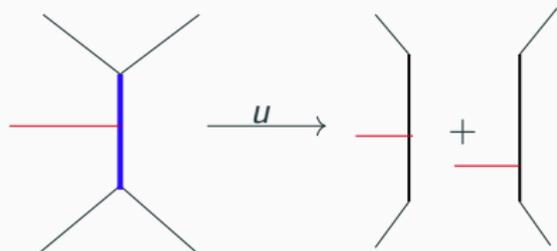

The circuit algebra of **arrow diagrams** is the complete circuit algebra in \mathbb{Q} -vector spaces

$$A := \text{CA} \langle \uparrow\uparrow, \uparrow, \curvearrowright \mid 4T, TC, VI, CP, RI \rangle$$

with the associated graded of the w -foam skeleton operations: S_e, A_e, d_e , unzips u_e .

The associated graded: arrow diagrams

How does this relate to the KV solutions?

A **tangential derivation** on $\widehat{\mathfrak{lie}}_n$ is a derivation u of $\widehat{\mathfrak{lie}}_n$ which acts on the generators x_i by $u(x_i) = [x_i, a_i]$, for some $a_i \in \widehat{\mathfrak{lie}}_n$.

Precisely:

$$\text{SolKV} = \text{SolKV}(\mathbb{Q}) := \left\{ (F, r) \in \text{TAut}_2(\mathbb{Q}) \times u^2\mathbb{Q}[[u]] \mid \right. \\ \left. F(e^x e^y) = e^{x+y} \text{ and } J(F) = \text{tr}\left(r(x+y) - r(x) - r(y)\right) \right\}.$$

How does this relate to the KV solutions?

Ex (1) $t^{1,2} = (y, x) \in \mathfrak{tder}_2$.

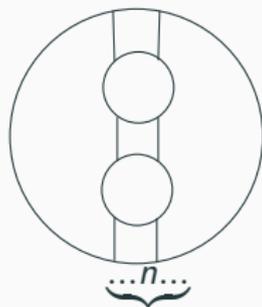

Ex (2) $u = (0, [[x, y], z], 0) \in \mathfrak{tder}_3$

How does this relate to the KV solutions?

There is an isomorphism of Hopf algebras

$$A(\uparrow_n) \cong \hat{U}((\mathfrak{tdet}_n \oplus \mathfrak{a}_n) \ltimes \text{cyc}_n).$$

A **homomorphic expansion** of w -foams is a circuit algebra homomorphism $Z : wF \rightarrow A$ such that:

- its linear extension $Z : \mathbb{Q}[wF] \rightarrow A$ is a filtered, skeleton preserving homomorphism
- $\text{gr}Z = \text{id}_A$.

Theorem (Dancso-Halacheva-R)

For any homomorphic expansion the induced map $\widehat{Z} : \widehat{wF} \rightarrow A$ is an isomorphism.

Theorem (Bar-Natan – Dancso)

There is a one-to-one correspondence:

$$\{\text{v-small exp}\} \Leftrightarrow \{\text{SolKV}\}.$$

The graded group KRV

$$\text{KRV} = \text{KRV}(\mathbb{Q}) := \left\{ (\alpha, s) \in \text{TAut}_2(\mathbb{Q}) \times u^2\mathbb{Q}[[u]] \mid \right. \\ \left. \alpha(e^{x+y}) = e^{x+y} \text{ and } J(\alpha) = \text{tr}(s(x+y) - s(x) - s(y)) \right\}$$

$\text{SolKV} \overset{\curvearrowright}{\longleftarrow} \text{KRV}$ is given by $F \cdot \alpha = \alpha^{-1} \circ F$.

Theorem (Dancso-Halacheva-R)

There is an isomorphism of groups $\text{Aut}_v(A) \cong \text{KRV}$.

The group KV

$$\text{KV} = \text{KV}(\mathbb{Q}) := \left\{ (a, \sigma) \in \text{TAut}_2(\mathbb{Q}) \times u^2\mathbb{Q}[[[u]]] \mid \right. \\ \left. a(e^x e^y) = e^x e^y \text{ and } J(a) = \text{tr}(\sigma(\text{bch}(x, y)) - \sigma(x) - \sigma(y)) \right\}$$

$\text{KV} \curvearrowright \text{SolKV}$ is given by $a \cdot F = F \circ a^{-1}$.

Theorem (Dancso-Halacheva-R)

There is an isomorphism of groups $\text{Aut}_v(\widehat{wF}) \cong \text{KV}$.

The relationship between KRV and GRT_1

- **chord diagrams** are pictorial depictions of $\hat{U}(\mathfrak{t}_n)$
- There's an inclusion of Lie algebras $\mathfrak{t}_n \hookrightarrow \mathfrak{tder}_n$.

Lemma (Dancso-Halacheva-R)

For each $n \geq 2$ there exists an inclusion of Hopf algebras

$$\mathrm{Hom}_{\mathrm{CD}(n)}(*, *) \xrightarrow{\varepsilon} A(\uparrow_n).$$

The relationship between KRV and GRT_1

Theorem (Bar-Natan, Fresse)

There is an isomorphism of groups $\text{Aut}_0(\text{PaCD}) \cong GRT_1$.

$$\begin{array}{l} p_2 = (\begin{array}{|c|} \hline | \\ \hline \end{array} \quad (\begin{array}{|c|} \hline | \\ \hline \end{array})) \\ p_1 = ((\begin{array}{|c|} \hline | \\ \hline \end{array}) \quad \begin{array}{|c|} \hline | \\ \hline \end{array}) \end{array}$$

$$\xrightarrow{c_{p_1 p_2}}$$

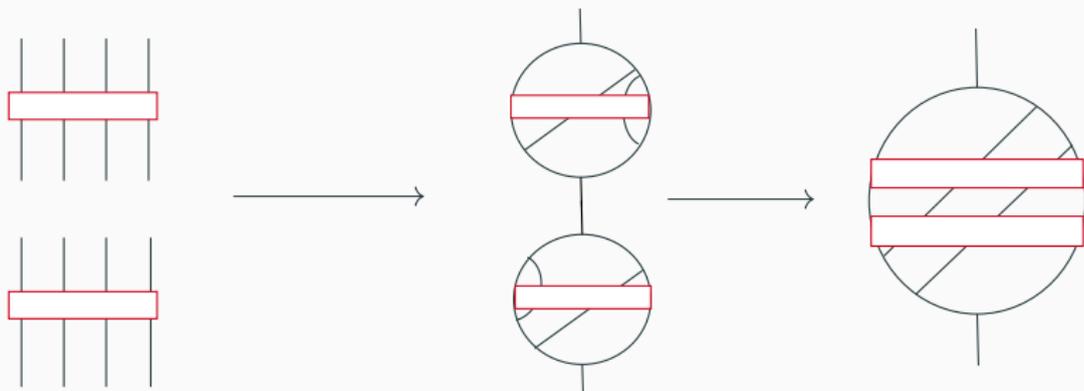

The relationship between KRV and GRT_1

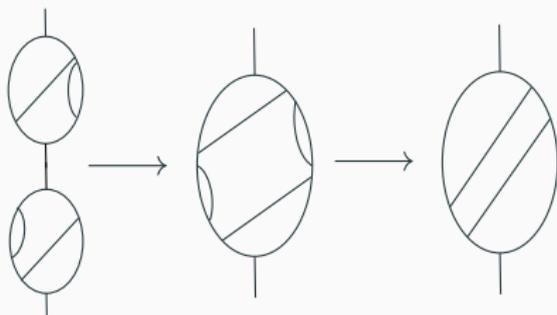

Theorem (Dancso-Halacheva-R)

There is an inclusion of Hopf groupoids

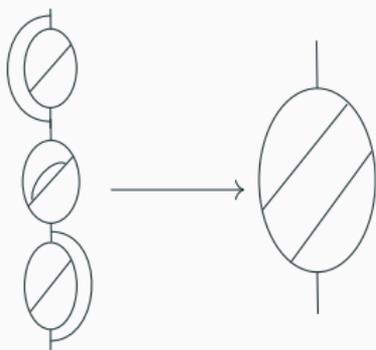

$$\text{PaCD}(n) \xrightarrow{\varepsilon} \bigcup_{c_{p_i p_j}} A(c_{p_i p_j}).$$

The pentagon

=

Theorem (Dancso-Halacheva-R)

The (isomorphic) image of GRT_1 in $\text{Aut}_v(A)$ is the subgroup

$$E = \{\tilde{G} \in \text{Aut}_v(A) : \tilde{G}(\emptyset) = \varepsilon(G(\mathcal{A})) \text{ for some (unique) } G \in \text{Aut}_0(\text{PaCD})\}.$$

Thanks!
